

Thrust 1: Configurable Trust Substrates

Trust descriptors, configurable TCB synthesis, hardware/software attestation

Thrust 2: Compartment-Aware Runtime Evidence

Linear-space runtime evidence, interrupt-aware verification, secure measurement generation

Thrust 3: Verifiable Compartmentalization and Trust Recovery

Verification-aware partitioning, authenticated boundary enforcement, selective recovery and re-attestation

Unified Trust Goal: prove that the correct hardware/software trust substrate was established, the correct runtime behavior and boundary events were attested, compromised components remained contained, and trusted service could be selectively recovered.
